ABSTRACT OF THE DISCLOSURE

A low k interlevel dielectric layer fabrication method includes providing a substrate having integrated circuitry at least partially formed thereon. An oxide comprising interlevel dielectric layer comprising carbon and having a dielectric constant no greater than 3.5 is formed over the substrate. After forming the carbon comprising dielectric layer, it is exposed to a plasma comprising oxygen effective to reduce the dielectric constant to below what it was prior to said exposing. A low k interlevel dielectric layer fabrication method includes providing a substrate having integrated circuitry at least partially formed thereon. In a chamber, an interlevel dielectric layer comprising carbon and having a dielectric constant no greater than 3.5 is plasma enhanced chemical vapor deposited over the substrate at subatmospheric pressure. After forming the carbon comprising dielectric layer, it is exposed to a plasma comprising oxygen at a subatmospheric pressure effective to reduce the dielectric constant by at least 10% below what it was prior to said exposing. The exposing occurs without removing the substrate from the chamber between the depositing and the exposing, and pressure within the chamber is maintained at subatmospheric between the depositing and the exposing.
